HS283K11 140682 bp DNA PRI 23-APR-1999
Human DNA sequence from clone 283K11 on chromosome 6q23.1-24.3.
Contains part of the EYA4 gene for eyes absent (Drosophila) homolog
A. Contains ESTs and GSSs, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human.

Direct Submission

La Submitted (16-APR-1999) Sanger Centre, Hinxton, Cambridgeshire,
CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk
On Apr 25, 1999 this sequence version replaced gi:4581315.
During sequence assembly data is comparated from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence is the entire insert of clone 283K11. This sequence
has been finished according to sequencing problems, such as
attempt is made to resolve all sequencing problems, such as
compressions and repeats, but not necessarily within known
                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6 283K11 is from the library RPCII constructed at the Roswell Park Cancer Institute by the group of pieter de Jong. For further details see http://bacpac.med.buffalo.edu/ VECIOR: pcrPAC2.
                                                                                                                                                                                                                                                                                                                                                                                annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7320. .7617 .

```
This sequence is of BAC T22018 from Arabidopsis thaliana chromosome insert of this clone. It is shorter by 11541 bp because we submit only the unique sequence of the clone. However, in order to facilitate the joining of overlapping clones in the future for creation of larger contigs, we provide a small overlap (200 bp) between overlapping submitted clones. The 5' end of this sequence overlaps by 200 bp the 3' end of the sequence of the BAC F19610.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /evidence-int_experimental

The orientation of the sequence is from SP6 end to 77 end. Genes were identified by a combination of five methods including: XGRALL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Mashington), Genscan (Chris Burge, http://gnomic.stanford.Edu/-chris/GenscAmw.htm))searches of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          complete sequence against a peptide database, and the Human gene Index database at TiGR (http://www.tigr.org/tdb/hqi/hqi.html). Genes without pepetide homolgy having spliced EST hits are termed 'Unknown gene product'. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE).

Use of an ordered cosmid library to deduce the genomic organization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The Sanger Centre is funded to complete the sequence of M. leprae by the Heiser Program for Research in Leprosy and Tuberculosis of The New York Community Trust.

The New York Community Trust.

Work in Paris is supported by the Heiser Trust, the Association Francaise Raoul Follereau and the Groupement de Recherches et des Etudes des Genomes (GIP-GREG).

Details of M. leprae sequencing at the Sanger Centre are available on the World Wide Web.

(URL, http://www.sanger.ac.uk/pathogens/)

CDS are numbered using the following system eg MLCB33.01c. ML (M. leprae), CB33 (cosmid name), .01 (first CDS), c (complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (21-APR-1997) Mycobacterium leprae sequencing project, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 15A E-mail: barrell@anger.ac.uk Cosmids supplied by Dr. Stewart T. Cole, [3] Unite de Genetique Moleculaire Bacterienne, Institut Pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France Requests for cosmids should be sent to Karin Eiglmeier

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. All CDS over 100 codons have been analysed. Gene prediction is based on positional base preference in codons especially where there is an increase in the observed/expected third position G + C. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg. gtg. or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.

IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid #CONIIG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note="MLCB33.02c, possible glycosyl transferase, len: 392 aa, identical to Q49841 Q49841 U2235C except more upstream initiation codon chosen on the basis of similarity eg to CRIX_ERWHE COU330 zeaxanthin glucosyl transferase (413 aa), fasta scores, opt: 233, E(): 1.4e-07, (26.1% identity in 410 aa overlap)"

                                                                                                of mind 2: Page 33; 41pp; English.

Interleukin 1-beta (Ir-1-beta) primers 1 and 2 (V32392) were used to maplify the IL-1-beta gene region to identify single base variation polymorphism of C/T at base 51.

The mathod for predicting the risk of sight threatening diabetic retinopathy. The method for predicting the risk of sight threatening diabetic retinopathy. The method for predicting DNA from a patient and determining the DNA polymorphism pattern of the genes that code for in erleukin-1-alpha, interleukin-1-beta and interleukin-1RN. The polymorphic pattern of patterns thereby identifying patients carrying a genetic polymorphism associated with increased risk of sight threatening diabetic retinopathy. The method may be able to identify diabetic patients at risk before the clinically detectable disorders occur. Polymorphism pattern of IL genes involved PCR reactions using primers v32389. We method is also claimed to be useful in conjunction with retinopathy in genomic DNA and therefore, in identifying diabetic patients expressing multiple risk patterns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    predisposition to coronary artery disease. The method is used to genotype an individual's interleukin (IL)-1 loci, the overexpression of which correlates with coronary artery disease. The method is used to screen a patients' predisposition to coronary
Predicting increased risk of sight-threatening diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  comparative measurement of levels of expression of alleles from the interleukin 1 locus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 6; Page 15; 22pp; English.

PCR primers V60232-33 were used to amplify alleles associated with interleukin-18 [L-18]. The specification describes a method for determination of a patient's predisposition to coronary arrery disease. The method comprises comparing an allele with a second allele which is predictive of coronary artery disease, where similarity between the first and second alleles indicates a

    comprises identifying genetic polymorphism pattern for genes
    IL-1A, IL-1B and IL-1RN, useful to allow treatment before clinical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             V60232;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NAME OF THE PROPERTY OF THE PR
```

```
While you would be determining a patient's susceptibility to inflammatory disorders - by detecting the presence of an IL-1 (4411232)

The proper, useful in designing treatment strategies that modulate the activity of proteins produced by the IL-1 gene cluster

Claim 3; Page 33; 49pp; English.

Ca method has been developed for determining a patient's susceptibility to an inflammatory disorder. The method comprises the detection of an internation of IL-1) (44112332) haplotype in a sample obtained from the patient, where its presence indicates susceptibility to an inflammatory disorder. X16607 to X16631 represent PCR primer used in the method for detecting the IL-1 (44112332) haplotype. The method provides kits for the early prediction of a patient's susceptibility to inflammatory disorders, including coronary artery disease, osteoporosis, nephropathy of indiabetes mellitus, alopecia areata, Graves disease, systemic lupus cervithmantosus, lichen sclerosis and ulcerative colitis. The detection of alsorders, comprising diabetic retinopathy, juvenile chronic arthritis, allohers can be applied to particular inflammatory disease-associated haplotype enables determination of which alleles are causative, and this information is useful in designing treatment using various agents causative, and this information is useful in designing treatment contacter the activity of proteins produced by the IL-1 gene cluster are associated with particular centrally in the pathology of these diseases. Therefore, the use of IL-1 centrally in the pathology of these diseases. Therefore, the use of IL-1 centrally in the pathology of these diseases. Therefore, the use of IL-1 centrally in the pathology of these diseases. Therefore, the use of IL-1 centrally in the pathology of these diseases. Therefore, the use of IL-1 centrally in the pathology of these diseases. Therefore, the use of IL-1 centrally in the pathology of these diseases. Therefore, the use of IL-1 centrally in the pathology of these diseases. Therefore, the use of IL-1 central 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      X22303;

While you isolated nucleic acid encoding the new human cytokine Tango-77 - 18 we isolated nucleic acid encoding the new human cytokine Tango-77 - 18 weed to inhibit inflammation and to screen for specific modulators by Example 5; Figure 4; 226pp; English.

X02956-X03048 and X2230-X22304 are overlapping BAC genomic sequences containing alternatively spliced forms of human In-Ira. Such fragments of are used in the method of the invention which describes the isolation of a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a sociated with acute or chronic inflammation by binding to the interleukin-1 receptor in processes associated with acute or chronic inflammation, e.g. asthma, chronic syclopage of the cytokines and growth factors. Modulators of this protein are used to treat or prevent conditions associated with abnormal levels of inflammation, or activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid encoding the new human cytokine Tango-77 - used to inhibit inflammation and to screen for specific modulators
Example 5; Figure 3; 226pp; English.

X02956-X03048 and X22301-X22304 are overlapping BAC genomic sequences
Containing alternatively spliced forms of human IL-Ira. Such fragments
are used in the method of the invention which describes the isolation of
are used in the method of the invention which describes the isolation of
are used in the method of the invention which describes the isolation of
an novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a
containing alternative superfamily that is expected to inhibit
containing to the interleukin-1 receptor (IL-IR). It may
contained with acute or chronic inflammation, e.g. asthma, chronic
myelogenous leukaemia, rheumatoid arthritis, psoriasis and inflammatory
containing also induce or suppress interleukins, cytokines and
containing actors. Modulators of this protein are used to treat or prevent
interleukin-1 receptor; IL-1R; regulation; asthma; rheumatoid arthritis; chronic myelogenous leukaemia; psoriasis; inflammatory bowel disease; growth factors; treatment; IL-1 receptor complex; BAC; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human IL-1ra BAC contiguous DNA sequence 41. New nucleic acid encoding schwannomin-binding protein - useful for, e.g. diagnosis and treatment of brain tumours and in drug screening Claim 3; Page 53-57; 75pp; English.

This cDNA sequence encodes a human schwannomin-binding protein (SBP) (see W48928) that has been found to have functional involvement in the inititation of translation and is suggested to serve a role in the final steps of a signal transduction cascade from a human adult brain cDNA library using a yeast two-hybrid method with schwannomin isoform I as bait. Novel SBPs of the invention (see W48927-31) bind to the neurofibromatosis 2 (RP2) (Tom a human adult brain cDNA library using a yeast two-hybrid method with schwannomin, soform I as bait. Novel SBPs of the invention (see W48927-31) bind to the neurofibromatosis 2 (RP2) (Invention (see W48927-31) bind to the neurofibromatosis 2 (RP2) cargets for treating a broad variety of cancer pathologies, such as glioma, sarcoma, melanoma and hamartoma. They provide tragets for treating a broad variety of cancer pathologies, such as glioma, carcinoma, sarcoma, melanoma and hamartoma. SBPs are used of notein. SBP nucleic acids, oligonuclectides (including antisense), vectors containing these, transformed host cells and SBP polypeptides and antibodies of the invention can be used to screen for potental cardanning these, transformed host cells and SBP polypeptides and antibodies of the invention can be used to treat brain twell as cataracts and retinal disorders. Oligonucleciacides that cumours, such as glioma, schwannoma, meningioma and ependymoma, as the secretary of the invention can be used to treat brain twell as cataracts and retinal disorders. Oligonucleciacides that colds are used to identify or quantify nucleic acids are used to inhibit SBP expression. Single-stranded primars expressing exogenous nucleic acids are also claimed. Transgenic containing expressing exogenous nucleic acids are also claimed. SBP uncleic acids processing experience and for drug screening.
conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex. Sequence 10620 BP; 2746 A; 2407 C; 2411 G; 3049 T;

Wri: y# Council for identifying bacteria causing infectious disease - consists of a DNA fragment obtained by HindIII cleavage of the pathogenic bacterial genomic DNA expension of the claim 7: Page 78-82: 100pp; Japanese.

The nucleotide sequence of a 6914 bp probe obtained by digestion of Enterobacter cloacae genomic DNA with the restriction enzyme HindIII. The probes (055133-48 and 055752-58) represent other probes derived, by HindIII digestion of the genomes of Staphylococcus aureus, S. epidemia, Enterococcus faecalis, Pseudomonas aeruginosa, E.coli, Klebsiella pneumoniae or Enterobacter cloacae. The probes can be used to detect their respective microorganisms in clinical samples. Sequence 6914 BP; 1420 A; 1937 C; 1807 G; 1750 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      17-AUG-1998 (first entry)
Rhodosporidium toruloides cephalosporin esterase genomic DNA.
Cephalosporin esterase; antibiotic; ds.
Rhodosporidium toruloides strain ATCC 10657.
                                                                                                                                                                                                                                                                                                            DB 1; Length 6914; 48;

The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access nemory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the saureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a kit for the immunodetection of be used in a sample. S.aureus in implicated in numerous human diseases, including cellulitis, eyalid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences contained on the computer readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                            Claim 8: Fig 6A-B: 38pp; English.

Claim 8: Fig 6A-B: 38pp; English.

This nucleic acid molecule comprises genomic DNA of Rhodosporidium toruloides Arcc 10657 coding for cephalosporin esterase (see 1041059). It was isolated by using oligonuclectide probes (see 199709-12) based on the N-terminal sequence of the mature enzyme to recen Southern blots of R. toruloides chromosomal DNA. A cDNA clone (see V21460) is also provided. These isolated nucleic acid molecules can be used for the recombinant production of cophalosporin esterase using claimed expression vectors and claimed host cells (preferably Escherichia coll. R. toruloides.)

Cephalosporium acremonium or Penicillium chrysogenum). The cephalosporium esterase can be used for the hydrolysis of the 3' acctyl groups of cephalosporius. The polypeptide (even if catalytically inactive) can also be used for the production of catalytically inactive) can also be used for the production of antibodies for use in detection and purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                            Isolated cephalosporin esterase gene - obtained from Rhodosporidium toruloides, used to obtain products which can be used for hydrolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated cephalosporin esterase gene - obtained from Rhodosporidium toruloides, used to obtain products which can be used for hydrolysis of cephalosporins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 7; Fig 5; 38pp; English.

This cDNA clone codes for the cephalosporin esterase (see W54159) for Rhodosporidium coruloides ATCC 10657. It was isolated from total RNA of R. toruloides by first-strand cDNA preparation and amplification using a gene-specific primer and an adapter primer. A genomic DNA sequence (see V21461), which contains 5 introns, is also provided. These isolated nucleic acid molecules can be used for the recombinant production of cephalosporin esterase using claimed expression vectors and claimed host cells (preferably Escherichia coli, R. toruloides, Cephalosporium acremonium or Penicillium chrysogenum). The cephalosporin esterase can be used for the hydrolysis of the 3 acetyl groups of cephalosporins. The

New isolated uropathogenic E. coli nucleotide sequences - used to develop products for the detection of pathogenic E. coli and to elicit an immune response to pathogenic E. coli and to claim 21, page 224; 250pp; English.

Claim 21, Page 224; 250pp; English.

Claim 21, Page 224; 250pp; English.

Chis sequence represents a E. coli strain J96 contig containing pathogenicity island (PAL) sequences, and represents a nucleic acid molecule of the invention. Pals are large fragments of DNA which comprise pathogenicity determinants. The sequences of the invention are taken from the E. coli chromosome and is greater than 170 kb. PAI vo pal IV is located at approximately 94 min (at pheR) on the E. coli chromosome and is approximately 160 kb in size. Antibodies specific to the proteins encoded by the PAI open reading frames of the invention can be used in kits to detect uropathogenic E. coli. The proteins are used in vaccines to elicit a privatic immune response in an animal to the uropathogenic E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   E. coli J96 pathogenicity island contig #112.

Claim 4; Page 22-24; 34pp; English.

Claim 4; Page 22-24; 34pp; English.

Codes for an enzyme, the mature form of which (R89927) can hydrolyse collulose and xylan. The gene was obtd. by ligating Sau3A fragments of A. cellulolyticus genomic DNA into EMBL3 lambda phage arms, packaging the phage DNA, plating on E.coli LE392 agar contg. CMC, staining with Congo Red, and isolating DNA from positive clones. Alternative signal sequences were identified (see also R89928-29). The gene can be incorporated into a vector and used for large-scale, low-cost prodn. of recombinant El endoglucanase, pref. using Saccharomyces, Zymomonas or E.coli hosts. The enzyme is useful for the saccharification of cellulosic biomass for fermentation to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Claim 22; Fig 29; 309pp; French.
Sequences X34001-X34252 represent nucleic acids encoding secreted proteins from various Mycobacterium species microorganisms. The nuclectide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.
